16.1 Disaster Plans

16.1.1 In the interest of protecting a historic structure, the development of a disaster plan can be useful, mitigating the endangerment of those parts of the structure which are saved from a fire, flood or other devastation. This could involve compiling an inventory of special architectural features and fixtures, a drawn record or photographs of the building or those parts of it considered as being of special interest. These records should be stored at a separate location, away from the protected structure. Priorities for saving objects or features in the event of disaster can then be made. The inventory could also serve as an archive in the event of a total loss.

16.2 Mitigating the Loss and Salvaging Materials

16.2.1 In order to mitigate damage to the protected structure and to minimise the loss of historic fabric, steps need to be taken speedily in the aftermath of a fire or other disaster. Firstly the stability of the remaining fabric should be assessed and the building made structurally stable before access is allowed for other purposes. Where necessary, the fabric of the building should be protected from further damage by weather or decay. This may require the erection of a temporary roof. Provision should be made to facilitate, in an appropriate manner, the drying-out of fabric and contents saturated as a result of fire-fighting measures. Careful consideration should be given to minimising the risk to remaining, and potentially salvageable, elements which could be further damaged through the drying-out process.

16.2.2 The building should be made secure against vandalism and all features of value, including architectural fragments and building materials, should be protected and salvaged. Records should be made of the remaining and damaged material and mapped locations of the salvaged debris. An owner or occupier may need to call on specialist expertise regarding methods of storing or conserving salvaged elements such as finishes, joinery or plasterwork.

16.3 Rebuilding After Total Loss

16.3.1 In most cases where a disaster such as a fire has caused total, or near total, loss of a historic building, the special interest which led to its inclusion in the RPS may be considered irredeemably lost and the building of a replica replacement will generally serve little purpose. In such cases, the building should be deleted from the RPS. However, if the building formed part of a larger architectural design such as a terrace, square or other group of buildings or was an important urban or rural landmark, then the reconstruction in replica of at least the exterior or other elements of the structure may be considered necessary in order to protect the setting of other historic structures or the character of an ACA.
16.4 Partial Loss

16.4.1 The total loss of a building in a disaster is very rare. Partial loss of a structure is more common. This is also more problematic and will require a careful assessment of the remaining building fabric. A judgement will need to be formed by the planning authority as to what constituted the special interest of the structure and to what extent that special interest has been compromised by the damage. The effect of the damage on adjacent protected structures or on the character of an ACA should also be considered.

16.4.2 The assessment will need to consider the type and extent of the damage and the importance of the damaged portion to the quality of the whole. It may be difficult to identify the point at which the building is so damaged that full reinstatement is neither worthwhile nor desirable. Each case will have to be considered on its own merits, as standard procedures cannot be applied.

16.4.3 Where the damaged section of the building is part of an architectural composition, or one which is symmetrical or where the building forms part of a formal composition, then it may be considered essential to reinstate the damaged section fully, or at least externally, even where a substantial proportion of the historic fabric has been lost.

16.5 Reinstatement of Interiors

16.5.1 Where the interior of a protected structure is almost entirely lost but the external shell remains substantially intact, the requirement may be to repair or reinstate the exterior fabric but allow the interior to be rebuilt in a different manner. Much will depend on the quality of the interior before the disaster. Where a high-quality interior has been damaged and substantial fragments remain, the recreation of the interior incorporating those surviving fragments may be appropriate, providing this can be done without an undue amount of conjecture.
